WATER TREATMENT PRODUCTS

CSI REACTR™ Systems

REACTR™ systems remove foul water odor, bad taste and eliminate staining caused by minerals in the earth.

REACTR™ water treatment systems employ advanced natural aeration technology that:

- Improves bad taste, odor and color
- Eliminates sediment problems
- Halts iron stains and sulfur odor

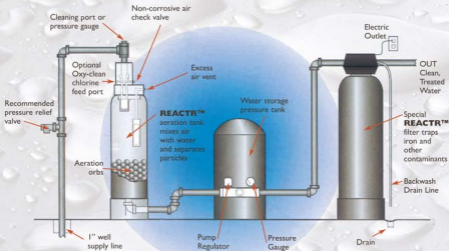

Air is mixed with water, trapping iron particles and exhausting the smell of sulfur. Contaminants are trapped by the **REACTR™** filter that contains special **REACTR™** Blend media. The result is clear, fresh water attained without the use of chemicals!

WATER TREATMENT SYSTEMS

Typical **REACTR™** Installation

While **REACTR™** stops most of the problems associated with iron stains and sulfur odor, a softener may still be required to alleviate certain hard water conditions. Your CSI dealer can determine whether or not your water requires both solutions.

Sizing CSI Water Systems

Sizing your system is easy! Your CSI dealer or contractor will test and analyze your water to determine the proper system size for your home. The valve controls are adjusted based on your home's water hardness level.

Ultimate REACTR™

Requiring less ceiling height than a standard **REACTR™** tank, the **ULTIMATE REACTR™** saves space and allows additional contact time for water with high levels of iron, manganese and sulfur. Combined with the Signature Series control valve, the **ULTIMATE REACTR™** provides unsurpassed water quality, as well as replaces your tank pressure.

REACTR VS™

Versatility is the best thing about the **REACTR VS™**. Use with constant pressure (variable speed) pumping systems as well as jet pump systems. It employs a high output, oil-less air compressor providing aeration power for chemical-free treatment of problem well water.

Each **REACTR™** system can include an additional **OXYCLEAN™** option that cleans your water supply system from the aeration tank to the filter. Chlorine is injected into the aeration tank and removed through the backwash, allowing the pressure tank lines to be cleaned without leaching chemicals into your drinking water.

Special Options

HydroxR™ Systems

HydroxR™ Aeration/ Peroxide System

The **HydroxR™** combines the pressurized aeration technology of **REACTR™** with the oxidation power of hydrogen peroxide enabling it to treat virtually unlimited levels of iron, manganese and sulfur gas. With the addition of the Signature Series control valve you will have a superior water treatment system that will provide unparalleled performance.

The **HydroxR VS™**, for use with constant pressure (variable speed) pumping systems, will treat extreme levels of iron, manganese and sulfur gas. It works equally well with jet pump systems unlike typical air injection models.

Reverse Osmosis (RO)

Reverse osmosis is one of the most convenient and economical methods of reducing unwanted impurities in your drinking water. Water molecules are forced through a semi-permeable membrane allowing most of the contaminants to be removed to the drain while the refined water is routed to a holding tank.

The Microline® TFC-3 is the most streamlined, user-friendly RO system on the market. It utilizes the latest technology and is validated by the National Sanitation Foundation, Water Quality Association and the state of Wisconsin Department of Industry, Labor and Human Relations.
